

Green Finance & Sustainable Investing Courses

Don't you wish you had invested in Microsoft twenty years ago? Personal computers changed the way we all work and early investors in Microsoft are all retired millionaires. What if you'd bought Cisco in 1995?

The internet and dot.com firms changed the way we get information and Cisco's stock led the way. Now the Green Revolution will change the way we power our world. The Green Revolution is really an energy revolution. Oil, gas and coal will become energy sources discussed in history books along with water wheels and oxen. Renewables such as wind, solar and biofuels are the energy sources of the future. So what stocks should you buy now to be part of the next great investment boom?

Our introductory class will look at all of the new energy technologies that are emerging in today's world. It will combine up-to-date information with time-tested investment techniques to show you how to profit. Topics will include the future of the energy industry, an in-depth look at new energy sources, techniques on finding new energy companies and investment analysis of explosive growth stocks.

The advanced class will look at actual companies that are bringing new and innovative energy technologies to the market. You will learn techniques to evaluate these companies and help you differentiate the next Microsoft and Cisco from the next Commodore and eToys. Topics will include learning from past boom mistakes, the behavior of investors in a bull market and analysis of actual wind, solar and biofuel companies.

Atlas is excited to announce that it has partnered with The Center for Investment Research to offer its latest series on sustainable investing. For further information, or to schedule a course or seminar, please contact us and visit our websites at www.atlas-e.com and www.investmentresearch.org.
